

LIONAEL SURYA DWITAMA

suryalionael@gmail.com | +1 437-606-8490 | lionael-portfolio.vercel.app | github.com/suryalionael | Toronto, ON

PROFESSIONAL SUMMARY

Data Science & Analytics student who builds AI-powered market screening and quantitative trading tools rather than just studying markets — including an XGBoost/LLM-driven Indonesian equities screener and a quant trading system built for a national IDX trading competition. Works across Python, market data pipelines, and Excel to turn macro and fundamental research into ranked signals, portfolio construction logic, and automated reporting.

EDUCATION

Seneca Polytechnic — Honours Bachelor of Data Science and Analytics Toronto, ON
Newnham Campus | Cumulative GPA: 3.9/4.0 | President's Honour List (Winter 2025, Winter 2026) 2024 – Apr. 2028 (Expected)

- Relevant coursework: Statistical Methods for Data Science, Data Mining, Advanced Database Design, Business Intelligence I, Data Visualization, High Performance Computing, Simulation and Modelling

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript
Data & Market Analysis: pandas, XGBoost, statistical modeling, backtesting, Power BI, Microsoft Excel
AI & Automation: Anthropic Claude API, LLM-integrated research pipelines, workflow automation, GitHub Actions
Market Data & Infrastructure: yfinance, Index Alpha API, Parquet, walk-forward validation
Databases & Tools: MySQL, PostgreSQL, Supabase, Git, GitHub, VS Code

PROJECTS

Kompas100 Quant Trading System — ISTC 2026 Kompas100 Competition (IDX) 2026

- Built a quantitative trading system for the IDX Kompas100 stock universe, competing in a 14-day national trading contest judged on P&L performance and an investment pitch, with a top-7 finish as the target outcome
- Designed ML-based ranking signals with a walk-forward validation framework, benchmarking against naive 20-day momentum to isolate genuine predictive edge from noise
- Reframed portfolio sizing and concentration policy around probability of a top-7 finish rather than expected-return maximization, aligning construction with the competition's payoff structure
- Automated a scheduled market-report pipeline (Python + GitHub Actions) that generates and delivers a daily AI-written narrative covering ranked signals, fundamentals, and buy/sell/stop levels
- Extended an existing quality-filter module into a composite “Overall Health” score to support portfolio narrative and investment pitch material

IDX Stock Scanner Agent — AI-powered equities screening tool 2025 – Present

- Building and maintaining a three-layer AI-powered stock screening pipeline (rule-based filtering → XGBoost ranking → Claude API-generated explanations) across Swing, Scalping, and Long Term trading modes
- Replaced mock broker-flow data with a live market-data API integration, adding quota-safe batch fetching and cached Parquet storage to meet data-authenticity requirements ahead of monetization
- Built a trading-calendar module for exchange holiday awareness, enabling the pipeline to distinguish scan date from execution date and surface data-staleness warnings on the live dashboard
- Ran a structured technical audit across all scan modes, producing per-mode verdicts and prioritized fix lists to guide the path to production readiness

EXPERIENCE

Data Entry and Web Development July 2025 – Present
QuickRn Canada

- Maintained and updated WordPress website content, and diagnosed and resolved website and course-access issues through technical troubleshooting
- Documented technical issues and communicated resolutions professionally through customer-facing email support

Software Engineering Intern June 2025 – Aug. 2025
CV. Veda Sakti Dharma Jakarta, Indonesia

- Developed and tested a Python-based payroll tax (PPH 21) application, automating employee tax calculations and validating payroll data for reporting accuracy
- Debugged system issues and collaborated with the team to implement new features throughout development
